

# Tuning Tips

Moving any of the 2 sliders approximately 10cm (4inches) changes the key by a semitone. Both sliders can be fully in or out (to the 0 ring so it doesn't lose the seal) or any variation in between.

The additional slider can be added to the top slider for extra length to lower the key.

At the top of the top slider, where the mouthpieces attach is a slightly smaller 0 ring then the second 0 ring is slightly larger.

2 0 rings can be added on the slider to stop it from moving when playing in a fixed key. For ease of sliding use silicone spray or oil as a lubricant.

Use a clip on tuner with microphone mode.
